

UNITED STATES PATENT AND TRADEMARK OFFICE

BEFORE THE PATENT TRIAL AND APPEAL BOARD

SWISS PHARMA INTERNATIONAL AG,

Petitioners

v.

Patent Owner of
U.S. Patent No. 8,349,321 to Burke et al.
Appl. No. 12/52,978 filed Oct. 2, 2009
Issued Jan. 8, 2013

IPR Trial No. TBD

**PETITION FOR *INTER PARTES*
REVIEW OF U.S. PATENT NO. 8,349,321
PURSUANT TO 35 U.S.C. § 312 AND 37 C.F.R. § 42.108**

TABLE OF CONTENTS

I.	INTRODUCTION	1
II.	MANDATORY NOTICES (37 C.F.R. § 42.8)	3
	A. Real Party-In-Interest (37 C.F.R. § 42.8(b)(1))	3
	B. Related Matters (37 C.F.R. § 42.8(b)(2))	3
	C. Lead and Back-Up Counsel (37 C.F.R. § 42.8(b)(3))	4
	D. Service Information (37 C.F.R. § 42.8(b)(4))	4
III.	FEE PAYMENT AUTHORIZATION (37 C.F.R. § 42.103)	4
IV.	GROUND FOR STANDING (37 C.F.R. § 42.104(a))	5
V.	IDENTIFICATION OF CHALLENGE AND GROUNDS (37 C.F.R. § 42.104(b))	5
	E. Effective Filing Date of the '321 Patent	6
	F. Prior Art and Statutory Grounds for the Challenge (37 C.F.R. § 42.104(b))	6
VI.	SUMMARY OF THE '321 PATENT AND PROSECUTION HISTORY	7
	A. Level of Ordinary Skill in the Art	10
	B. Claim Construction (37 C.F.R. § 42.104(b)(3))	10
VII.	DETAILED EXPLANATION (37 C.F.R. § 42.104(b)(4)-(5))	12
	A. Scope and Content of the Prior Art	13
	1. The IgG mAb Natalizumab	13
	2. Prior Art IgG Formulations	14
	3. Prior Art Natalizumab Formulations	18
	B. Ground 1 – The Challenged Claims are Obvious under 35 U.S.C. § 103(a) over van Oosten or Zenapax in view of Sorbera	20
	1. Challenged Claim 1	22
	2. Challenged Claim 2	34
	3. Challenged Claim 3	36
	4. Challenged Claim 4	37

5.	Reasonable Expectation of Success	37
C.	Ground 2 – The Challenged Claims are Obvious under 35 U.S.C. § 103(a) over Gordon in View of Orthoclone or Aversano	42
1.	Challenged Claim 1.....	44
2.	Challenged Claim 2.....	53
3.	Challenged Claim 3.....	53
4.	Challenged Claim 4.....	54
5.	Reasonable Expectation of Success	55
D.	Statement of No Redundancy	56
E.	Secondary Considerations of Nonobviousness Fail to Overcome the Strong <i>Prima Facie</i> Showing of Obviousness	56
F.	The Examiner Relied On Incorrect and Incomplete Information	58
VIII.	CONCLUSION	59

Pursuant to 35 U.S.C. § 311 et seq. and 37 C.F.R. § 42.1 et seq., Swiss Pharma International AG (“Petitioner”) hereby submits this petition for *inter partes* review (“Petition”) of U.S. Patent No. 8,349,321 (“the ‘321 patent”) (Ex. 1001). Petitioner respectfully submits that claims 1-4 (the “Challenged Claims”) of the ‘321 patent are unpatentable under 35 U.S.C. § 103 in view of the prior art discussed herein.

I. INTRODUCTION

The Challenged Claims cover an old therapeutically active agent paired with a standard well-known formulation repeatedly and successfully used with numerous other therapeutically active agents from the same class of compounds. The therapeutically active agent is natalizumab, discovered years before the earliest effective filing date for the ‘321 patent. Natalizumab is a monoclonal antibody (“mAb”) belonging to the immunoglobulin G (“IgG”) class of compounds. The formulation recited by the Challenged Claims is also old. Numerous prior art IgG mAb formulations, including multiple FDA-approved prior art formulations, contain the exact same combination of three excipients recited by the Challenged Claims – (1) sodium phosphate buffer, (2) sodium chloride and (3) polysorbate 80. Given the repeated success of this formulation with other IgG mAb actives, the rationale for its combination with natalizumab is strong. Further, protein formulators skilled in the art looked to this formulation

with these other IgG mAb actives because they reasonably expected it to work. Consequently, its combination with natalizumab in the Challenged Claims is obvious.

The remaining limitations, such as concentration or pH of the formulation, are either necessarily satisfied or recite nothing more than result effective variables subject to routine optimization. It is, of course, well-settled that differences in concentration and pH do not support patentability in the absence of some evidence of criticality or unexpected results. But nothing critical or unexpected is present here.

Indeed, the allegedly unexpected results Applicants relied upon during prosecution to gain allowance arose from a “Preformulation Study” that Applicants themselves publicly admitted is inaccurate, non-reproducible and unresponsive of the conclusion of unexpected results. Specifically, on July 6, 2010, a year before presenting the Preformulation Study during prosecution of the ‘321 patent, Applicants’ representative admitted to the European Patent Office (EPO) that the study was “based on preliminary data which was not accurate . . . [and] could not be reproduced.” (Ex. 1040 at 1.) Yet, Applicants never told the Examiner about this problem, and in fact relied on the Preformulation Study as a primary basis for overcoming the Examiner’s repeated obviousness rejections. Unexpected results do not rescue the ‘321 patent here.

Thus, there is a reasonable likelihood that at least one, if not all, of the Challenged Claims of the '321 patent are obvious. Petitioners respectfully request that the Board institute an *inter partes* review of the '321 patent pursuant to 35 U.S.C. § 314 and 37 C.F.R. § 42.108.

II. MANDATORY NOTICES (37 C.F.R. § 42.8)

A. Real Party-In-Interest (37 C.F.R. § 42.8(b)(1))

Petitioner certifies that Swiss Pharma International AG is a real party-in-interest. Petitioner is a subsidiary that is owned by Medana Pharma SA, Polfa Warsaw SA (also known and registered as Warszawskie Zakłady Farmaceutyczne Polfa S.A.) and Pharmaceutical Works Polpharma SA (also known and registered as Zakłady Farmaceutyczne Polpharma SA). Polfa Warsaw SA and Medana Pharma SA are in turn owned by Zakłady Farmaceutyczne Polpharma SA (also known as Pharmaceutical Works Polpharma SA).

B. Related Matters (37 C.F.R. § 42.8(b)(2))

Petitioner is concurrently filing two additional petitions for *inter partes* review that will address certain claims of U.S. Patent No. 8,815,236 (“the ‘236 patent”) and U.S. Patent No. 8,900,577 (“the ‘577 patent”). The ‘236 and ‘577 patents are related to each other and to the ‘321 patent as continuations or divisionals.

C. Lead and Back-Up Counsel (37 C.F.R. § 42.8(b)(3))

Petitioner designates the following as lead and back-up counsel, all with Axinn, Veltrop & Harkrider LLP:

Lead Counsel	Back-up Counsel
Jeremy Lowe, Reg. No. 48,089 90 State House Square, 9 th Floor Hartford, CT 06103 Tel: (860) 275-8100 Fax: (860) 275-8101 jlowe@axinn.com	Jonathan A. Harris, Reg. No. 44,744 jharris@axinn.com Jason W. Balich, Reg. No. 67,110 jbalich@axinn.com 90 State House Square, 9 th Floor Hartford, CT 06103 Tel: (860) 275-8100 Fax: (860) 275-8101

A power of attorney is submitted herewith pursuant to 37 C.F.R. § 42.10(b).

D. Service Information (37 C.F.R. § 42.8(b)(4))

Service of any documents via hand-delivery may be made at the postal mailing addresses of lead and back-up counsel identified above with courtesy copies to the respective email addresses stated above. Petitioners consent to electronic service at these same email addresses.

III. FEE PAYMENT AUTHORIZATION (37 C.F.R. § 42.103)

In accordance with 37 C.F.R. § 42.103(a), Petitioner authorizes the Patent Office to charge Deposit Account No. 013050 for the fees set forth in 37 C.F.R. § 42.15(a). If payment of additional fees is due during this proceeding, the Patent

E. Effective Filing Date of the ‘321 Patent

The ‘321 patent was filed as Appl. No. 12/572,978 (“the ‘978 application”) on October 2, 2009. It is a continuation of Appl. No. 10/773,406, filed on February 9, 2004, which in turn claims priority to provisional Appl. No. 60/445,818 (“the ‘818 application”), filed on February 10, 2003. For purposes of this petition only, Petitioners have assumed that the earliest effective filing date of the Challenged Claims is February 10, 2003. Petitioners do not otherwise concede same for other purposes.

F. Prior Art and Statutory Grounds for the Challenge (37 C.F.R. § 42.104(b))

The scope and content of the prior art is described in Section VII.A, and the two proposed grounds of invalidity are described in Sections VII.B and VII.C. The Declarations of Dr. Christian Schöneich (Ex. 1002) and Dr. Staley Brod (Ex. 1011) support each of these grounds. As more fully set forth in their declarations, Dr. Schöneich is an expert in protein formulation (Ex. 1002 at ¶¶ 5-10, 85) and Dr. Brod is a medical expert (Ex. 1011 at ¶¶ 5-14). Each is qualified to provide opinions as to what a person of ordinary skill in the art would have understood, known or concluded as of February 10, 2003.

Petitioners respectfully request institution on each of the Challenged Claims based on two independent Grounds:

- **Ground 1** – Obviousness over either van Oosten (Ex. 1014) or Zenapax (Ex. 1024) in view of Sorbera (Ex. 1019); and
- **Ground 2** – Obviousness over Gordon (Ex. 1017) in view of either Orthoclone (Ex. 1022) or Aversano (Ex. 1023).

VI. SUMMARY OF THE ‘321 PATENT AND PROSECUTION HISTORY

The ‘321 patent relates to aqueous formulations comprising various therapeutically active proteins, especially antibodies and immunoglobulins. According to the ‘321 patent specification, “the invention provides for a stable, aqueous pharmaceutical formulation comprising an immunoglobulin (or other protein), a phosphate buffer, a polysorbate and sodium chloride.” (Ex. 1001 at 1:57-62.) The ‘321 patent specification states that virtually all proteins are interchangeable in this formulation, stating that “[a]lthough discussion of the formulation is provided mainly in reference to an antibody or immunoglobulin, other proteins are contemplated as interchangeable in the formulations disclosed.” (Id. at 2:62-65.)

Consistent with the ‘321 patent’s statement concerning interchangeability, all originally-filed independent claims broadly recite formulations comprising proteins or immunoglobulins without restriction, along with a phosphate buffer, a polysorbate, and sodium chloride. (Ex. 1042 at 1, 4 and 5 (claims 1, 29 and 33).)

No original independent claim specifically recited natalizumab, which originally appeared only in dependent claims. (See, e.g., id. at 3 (claims 14-16).)

In the first substantive Office Action, the Examiner rejected the pending claims as anticipated by U.S. Pat. No. 6,914,128 (“Salfeld”) (Ex. 1044) and as obvious over Salfeld in view of Gordon (Ex. 1017). (Ex. 1043 at 7.) The Examiner explained that Salfeld discloses an aqueous pharmaceutical formulation as claimed (id. at 4) and that although “[Salfeld] . . . does not particularly teach natalizumab,” Gordon cures the deficiency. (Id. at 8.)

In response, Applicants filed a series of successively narrowing amendments, adding natalizumab to the independent claims and specifically reciting the type and concentration of phosphate buffer and polysorbate compounds. Notwithstanding their statements in the ‘321 patent specification concerning interchangeability and their original decision to broadly claim formulations comprising any and all proteins and immunoglobulins, Applicants nevertheless argued that “one of skill in the art would appreciate that antibodies are not readily interchangeable in formulations. . . .” (Ex. 1045 at 12 (citing Ex. 1046; Ex. 1047).) Although unreported in the prior art, Applicants also argued that subsequent work (presumably its own work) on the Gordon formulation revealed it was unstable. (Ex. 1045 at 13-14.)

Applicants also relied heavily on the aforementioned “Preformulation Study” (Ex. 1038),¹ dated September 1994, as evidence that phosphate buffer, polysorbate 80 and sodium chloride represented an “unlikely combination of excipients” (Ex. 1045 at 11) and that “inclusion of sodium chloride and Tween [polysorbate] 80 was found to accelerate the degradation process” (Ex. 1045 at 10). As explained in Section VII.F below at page 58, Applicants publicly admitted the Preformulation Study “was not accurate . . . [and] could not be reproduced,” but never made or disclosed that admission to the Examiner. (Ex. 1040 at 1.)

In response to these arguments, the Examiner thus withdrew the obviousness rejection. (Ex. 1049 at 3.) After additional back and forth over enablement issues, the Examiner allowed the Challenged Claims. (Ex. 1050 at 1.) The Examiner did not provide reasons for allowance, although Applicants’ heavy reliance on the Preformulation Study just prior to withdrawal of the Examiner’s obviousness rejection likely played a significant role. (Ex. 1048 at 5.)

¹ As Dr. Schöneich explains, during prosecution of EP Appln. No. 04709508.8 (“EP ‘508”), Applicants submitted to the EPO Ex.1038, the same document as the “Preformulation Study” referenced by Applicants during the prosecution of the ‘321 patent and the related ‘577 patent (Ex. 1039). (Ex. 1002 at ¶ 168.)

A. Level of Ordinary Skill in the Art

A person of ordinary skill in the art of the '321 patent would have held a Ph.D. or other post-graduate training in protein chemistry or a related field with at least a few years of practical industrial or academic experience preparing protein formulations. (Ex. 1002 at ¶ 83.) The experience includes practical familiarity with assays for assessing protein stability and solubility so as to optimize a protein formulation based on the results. One of ordinary skill could also confer with medical doctors who have at least three years of knowledge or experience in treating patients with Crohn's Disease ("CD") or other disease states treatable with IgG mAbs. (Id.)

B. Claim Construction (37 C.F.R. § 42.104(b)(3))

A patent claim term in *inter partes* review is to be given the "broadest reasonable construction in light of the specification" as commonly understood by those of ordinary skill in the art. 37 C.F.R. § 42.100(b); see In re Cuozzo Speed Techs., LLC, 793 F.3d 1268, 1275 (Fed. Cir. 2015), cert. granted 84 U.S.L.W. 3218 (U.S. Jan. 15, 2016) (No. 15-446). Consistent with this standard, and without conceding that these terms should be construed the same way in a district court proceeding, Petitioner provides proposed constructions of certain of the claim terms as set forth below for purposes of this Petition only.

1. “Stable”

The ‘321 patent expressly defines this term by stating that “[a] ‘stable’ formulation is one in which the protein therein essentially retains its physical stability and/or chemical stability and/or biological activity upon storage. By ‘stable’ is also meant a formulation which exhibits little or no signs of instability, including aggregation and/or deamidation.” (Ex. 1001 at 5:55-60.) Although this passage offers alternate definitions, the broadest reasonable interpretation of “stable” merely requires that the formulation retains any one of physical, chemical or biological stability upon storage. (Ex. 1002 at ¶ 26.)

2. “Sodium phosphate buffer”

The ‘321 patent does not expressly define “sodium phosphate buffer,” but does expressly define “buffer” to mean “a buffered solution that resists changes in pH by the action of its acid-base conjugate components.” (Id. at 6:39-41.) The ‘321 patent further discloses that sodium phosphate can provide “[b]uffer and tonicity.” (Id. at 9:58-59.) Accordingly, the broadest reasonable construction of “sodium phosphate buffer” is “a buffered solution comprising one or more sodium phosphate salts that resists changes in pH by the action of its acid-base conjugate components.” (Ex. 1002 at ¶ 28.)

3. “Isotonic”

The ‘321 patent expressly defines the claim term “isotonic” to mean “that the formulation of interest has essentially the same osmotic pressure as human blood.” (Id. at 6:33-34.) The ‘321 patent further states that “[i]sotonic formulations will generally have an osmotic pressure from about 250 to 350 mOsm,” which may be measured using an “ice-freezing type osmometer.” (Id. at 6:33-38.)

4. “Container”

The ‘321 patent does not expressly define “container,” but makes clear that a container is any article that holds the formulation, citing “an intravenous solution bag” and a “vial” as examples. (Id. at 5:48-52.)

VII. DETAILED EXPLANATION (37 C.F.R. § 42.104(b)(4)-(5))

As mentioned, this case is about a known therapeutically active agent provided in a known formulation. At the time of the earliest effective filing date of the ‘321 patent, the IgG mAb natalizumab and its indications, including treatment of CD, were known. And the three excipients recited in the Challenged Claims – sodium phosphate buffer, sodium chloride and polysorbate 80 – were also known.

For example, prior art by von Oosten (Ex. 1014) teaches an aqueous formulation containing these very same excipients with an IgG mAb that, like natalizumab, was known to treat CD. Furthermore, Gordon teaches a natalizumab

formulation containing a buffer and polysorbate 80 which later undergoes dilution with saline thus adding sodium chloride. (Ex. 1017 at 7.) The buffer used in that formulation serves the same buffering function as sodium phosphate.

For the foregoing reasons, and as discussed in more detail below, the scope and content of the prior art points directly to the claimed subject matter of the '321 patent.

A. Scope and Content of the Prior Art

The Declarations of Scott Bennett (Ex. 1005) and Rachel J. Watters (Ex. 1008) establish the prior art status of all printed publications identified in this section of the Petition. Unless otherwise indicated, all such publications were publicly available prior to February 10, 2002 – one year before the earliest possible effective filing date of the '321 patent – qualifying them as prior art under 35 U.S.C. 102(b). Furthermore, with the exception of Gordon (Ex. 1017) and Bendig (Ex. 1018), none of the prior art relied upon here appears in the references cited section of the '321 patent.

1. The IgG mAb Natalizumab

Natalizumab was known at least as early as November 24, 1998. (Ex. 1018 at Figs. 6 and 7; Ex. 1051 at ¶ 0051 (stating Natalizumab was described in Ex. 1018); see also Ex. 1002 at ¶ 66.) The prior art classified natalizumab as a humanized IgG mAb. (Ex. 1018 at 2:44-48; Ex. 1017 at 6; Ex. 1019 at 2.) As Dr.

Schöneich explains, a person of ordinary skill would have known that all IgG mAbs, including natalizumab, share key structural characteristics that impact their general compatibility with the excipients used in aqueous formulations. (Ex. 1002 at ¶ 34 and discussed further starting at p. 39, below.) The prior art, specifically Sorbera, also confirms the efficacy (at least 3 mg/kg) and safety (up to 6 mg/kg) of natalizumab for the treatment of CD. (Ex. 1019 at 3-4.)

2. Prior Art IgG Formulations

The prior art is replete with IgG and IgG mAb formulations having the same excipients as those in the Challenged Claims at the same or similar concentrations.

a. Prior Art IgG Formulations Comprising Phosphate Buffer and Sodium Chloride

Commercial protein manufacturers routinely stored and shipped IgG antibodies in formulations containing sodium phosphate buffered saline, often abbreviated as PBS. (Ex. 1020 at 14 (USBio I19903-31 using “PBS”), 16 (Sigma F7381 using “phosphate buffered saline”); publicly available as of April 2002 (Ex. 1005 at 54).) A person of ordinary skill recognizes that PBS contains sodium phosphate and saline, which is an aqueous solution containing sodium chloride. (Ex. 1002 at ¶ 37.) White discloses numerous such formulations, many of which employed the same or similar concentrations recited by the Challenged Claims. For example, White discloses 20 mg/ml IgG formulations that use 10 mM phosphate buffered saline. (Ex. 1020 at 16 (Sigma F 7381, F 9636 and F 7256).)

These excipients help ensure the long-range stability of the IgG active drug substances. (Ex. 1002 at ¶ 36.) For example, Cummins reports 12 month stability (0° to 8°C storage) of a 5% (50 mg/ml IgG) solution in normal saline, disclosing “no changes detected in pH, [or] percentage of monomeric IgG.” (Ex. 1021 at 6, 8; Ex. 1002 at ¶ 79.) Similarly, White discloses several formulations comprising a 20 mg/ml concentration of IgG in 5 mM or 10 mM PBS. (Ex. 1020 at 14 (USBio I1903-31) and 16 (Sigma F 7381, F 9636 and F 7256).)

b. Prior Art IgG mAb Formulations Containing Sodium Phosphate, Sodium Chloride and Polysorbate 80

Because IgG mAb actives may aggregate, and thereby compromise stability, it was also well-known in the art to include a surfactant with such formulations. (Ex. 1002 at ¶¶ 59-60 (discussing Ex. 1029 at 15-20).) As Dr. Schöneich explains, typical prior art IgG mAb formulations include a buffer to maintain a specific pH over time, sodium chloride to provide tonicity and a surfactant to disperse the IgG mAb and thereby prevent aggregation. (Ex. 1002 at ¶¶ 39, 49-50, 59-61 (discussing Ex. 1029 at 11-13, 15-20; Ex. 1031 at 13-14; Ex. 1032 at 6, 9).)

At least four prior art IgG mAb formulations employ sodium phosphate buffer, sodium chloride and the surfactant polysorbate 80, as recited by the Challenged Claims. Furthermore, these prior art formulations employ these excipients at nearly the same concentrations as the Challenged Claims:

Table 1: Prior Art IgG mAb Formulations²

Ingredient	Claim	Orthoclone	Aversano	van Oosten	Zenapax
IgG mAb	20 mg/ml	1 mg/ml	5 mg/ml	10 mg/ml	5 mg/ml
Sodium Phosphate	~ 10 mM	16.4 mM	10 mM	10 mM	67 mM
Sodium Chloride	8.18 mg/ml	8.6 mg/ml	8.76 mg/ml	8.76 mg/ml	4.6 mg/ml
Polysorbate 80	0.2 mg/ml	0.2 mg/ml	0.1 mg/ml	0.1 mg/ml	0.2 mg/ml
pH	6.1	7.0 ±0.5	6.5	7.2	6.9

Orthoclone (Ex. 1022)

Orthoclone, approved by FDA in 1992, is a formulation comprising the IgG mAb muromonab-CD3. (Ex. 1022 at 3; Ex. 1030 at 1.) The formulation contains 1 mg/ml muromonab-CD3, 0.45 mg/ml monobasic sodium phosphate and 1.8 mg/ml dibasic sodium phosphate – equivalent to 16.4 mM sodium phosphate buffer (see Ex. 1002 at ¶ 71; see also p. 11, above for construction of sodium phosphate buffer), 8.6 mg/ml sodium chloride and 0.2 mg/ml polysorbate 80 in

² Dr. Schöneich provides routine conversions of units of measurement to compare reported values in the prior art to the claims. (Ex. 1002 at ¶¶ 65-79.)

water for injection. (Ex. 1022 at 3.) The formulation has a pH of 7.0 ± 0.5 and is supplied in ampules. (Id.) The formulation is stored at 2°C to 8°C . (Id. at 7.) Because Orthoclone was FDA approved, it retained its biological activity, i.e., was stable, at least long enough to be shipped from the manufacturer to the site of use. According to Remington, Orthoclone had a shelf-life of one year. (Ex. 1032 at 8.)

Aversano (Ex. 1023)

Aversano, published in 1995, discloses a formulation comprising the IgG mAb designated CLB54. (Ex. 1023 at 4, 5.) The formulation contains 5 mg/ml CLB54, 10 mM sodium phosphate, 8.76 mg/ml sodium chloride and 0.1 mg/ml polysorbate 80. (Id. at 5; Ex. 1002 at ¶ 72.) The formulation has a pH of 6.5. (Ex. 1023 at 5.)

van Oosten (Ex. 1014)

van Oosten, published in 1996, discloses a formulation containing the IgG mAb infliximab. (Ex. 1014 at 5 (“[e]ach vial contained . . . 10 mg/ml cA2.”); Ex. 1015 at 4 (disclosing that cA2 is also known as “infliximab”).) Like natalizumab, infliximab was known to treat CD. (Ex. 1014 at 4.) The formulation contains 10 mg/ml infliximab, 10 mM sodium phosphate buffer, 8.76 mg/ml sodium chloride and 0.1 mg/ml polysorbate 80. (Id. at 5; Ex. 1002 at ¶ 73.) The formulation has a pH of 7.2. (Ex. 1014 at 5.)

Zenapax (Ex. 1024)

Zenapax, approved by FDA in 1997, is a formulation comprising the IgG mAb daclizumab. (Ex. 1024 at 2; Ex. 1030 at 3.) The formulation contains 5 mg/ml daclizumab, 3.6 mg sodium phosphate monobasic monohydrate and 11 mg sodium phosphate dibasic heptahydrate – equivalent of 67 mM of sodium phosphate buffer (see Ex. 1002 at ¶ 74), 4.6 mg/ml sodium chloride and 0.2 mg/ml polysorbate 80. (Ex. 1024 at 2; Ex. 1002 at ¶ 74.) The formulation has a pH of 6.9. (Ex. 1024 at 2.) According to another prior art reference by Bell, the “[s]helf life of Zenapax is 1 year” and “[v]ials should be stored between 36° – 46° F” (equivalent to 2° C to 8° C). (Ex. 1025 at 4; Ex. 1002 at ¶ 75.)

3. Prior Art Natalizumab Formulations

In August 2001, clinical researchers reported a natalizumab formulation containing a buffer and the surfactant polysorbate 80, which later undergoes dilution with saline thus adding sodium chloride. (Ex. 1017 at 7.) Gordon reports results from a clinical trial for the treatment of CD with an aqueous natalizumab formulation comprising 5 mg/ml natalizumab, “50 mmol/L of histidine buffer and 0.02% polysorbate 80, adjusted to pH 6.”³ (Id. at 7.) This formulation then undergoes dilution through the addition of 0.9% saline (sodium chloride and

³ As Dr. Schöneich explains, Gordon teaches a formulation containing natalizumab, histidine and polysorbate 80 stored in a vial. (Ex. 1002 at ¶ 68.)

water). Post-dilution, Gordon further teaches that “[p]atients received a single 3 mg/kg intravenous infusion of natalizumab.” (Id.)

The buffer employed by Gordon was histidine, used to maintain the formulation pH at 6.0. (Id.) According to scientifically authoritative prior art texts, a few buffers were suitable for the pH disclosed in Gordon, including phosphate, citrate and histidine buffers. (Ex. 1029 at 13.)

Shortly after Gordon published, in October 2001, Subramanian reported that the use of both histidine and citrate buffers in an IgG mAb formulation containing polysorbate 80 results in “accelerated potency loss” of the IgG mAb active drug. (Ex. 1002 at ¶ 77; Ex. 1026 at 4.) According to Subramanian, histidine undesirably reacts with polysorbate 80 to form an impurity that oxidizes the IgG mAb. (Ex. 1026 at 4.) This helps explain Applicants’ later alleged discovery that Gordon was unstable. (Ex. 1002 at ¶ 77.) And given that Subramanian did not criticize sodium phosphate in this way, suggests how one of ordinary skill could fix it. (Id.)

Furthermore, although Gordon teaches dilution of its natalizumab formulation with saline prior to administration, nearly all the prior art aqueous IgG formulations include sodium chloride as part of the commercial formulation. In fact, it was well known that formulating at isotonic conditions was highly desired to allow for patient comfort. (Ex. 1011 at ¶ 22; Ex. 1032 at 6.) According to

Remington's (Ex. 1032), isotonic formulations are highly desirable because non-isotonic formulations, i.e., those that are hyper or hypotonic, "cause tissue irritation, pain on injection, and electrolyte shifts." (Ex. 1032 at 6.) "An isotonic solution, therefore, is the choice as a vehicle for many drugs which have to be administered parenterally." (*Id.* at 9.) To make that choice, skilled formulators could simply follow the teachings of Andya, which states that "[i]sotonic formulations will generally have an osmotic pressure from about 250 to 350 mOsm" and that "[i]sotonicity can be measured using a[n] . . . ice-freezing type osmometer." (Ex. 1010 at ¶ 0051.) The '321 patent appears to have copied this passage directly from Andya. (Ex. 1001 at 6:33-38.)

B. Ground 1 – The Challenged Claims are Obvious under 35 U.S.C. § 103(a) over van Oosten or Zenapax in view of Sorbera

Each of the primary references in Ground 1 – van Oosten (Ex. 1014) and Zenapax (Ex. 1024) – discloses an IgG mAb formulation comprising the identical excipients recited by the claims – sodium phosphate buffer, sodium chloride and polysorbate 80. Although van Oosten and Zenapax respectively contain infliximab and daclizumab as opposed to natalizumab, a single modification through the secondary reference – Sorbera (Ex. 1019) – cures this deficiency. Sorbera teaches that natalizumab, like the infliximab of van Oosten, is an IgG mAb that is useful for treating CD. In other words, these actives qualify as simple substitutes under the case law. In addition, modifying Zenapax with Sorbera combines known

elements (the Zenapax excipients and natalizumab) according to known methods of manufacture. (Ex. 1002 at ¶ 92.) Each combination of prior art references discloses all of the structural limitations recited by the Challenged Claims as exemplified by claim 1:

Claim 1	Prior Art
A stable, aqueous pharmaceutical formulation comprising	<p>van Oosten: “Each vial contained . . . 10.0 mg/ml cA2. . . .” (Ex. 1014 at 5.)</p> <p>Zenapax: “Each milliliter of ZENAPAX contains 5 mg of Daclizumab. . . .” (Ex. 1024 at 2.)</p> <p>Sorbera: “2 i. v. infusions (3 mg/kg) of natalizumab given 4 weeks apart.” (Ex. 1019 at 3.)</p>
20 mg/ml of natalizumab,	<p>van Oosten: “Each vial contained . . . 10.0 mg/ml cA2. . . .” (Ex. 1014 at 5.)</p> <p>Zenapax: “Each milliliter of ZENAPAX contains 5 mg of Daclizumab. . . .” (Ex. 1024 at 2.)</p> <p>Sorbera: “2 i. v. infusions (3 mg/kg) of natalizumab given 4 weeks apart.” (Ex. 1019 at 3.)</p>
about 10 mM sodium phosphate buffer,	<p>van Oosten: “Each vial contained . . . 0.01 M sodium phosphate.” (Ex. 1014 at 5.)</p> <p>Zenapax: “Each milliliter of ZENAPAX contains . . . 3.6 mg sodium phosphate monobasic monohydrate, 11 mg sodium phosphate dibasic heptahydrate. . . .” (Ex. 1024 at 2.)</p>
8.18 mg/ml sodium chloride,	<p>van Oosten: “Each vial contained . . . 0.15 M sodium chloride. . . .” (Ex. 1014 at 5.)</p> <p>Zenapax: “Each milliliter of ZENAPAX contains . . . 4.6 mg sodium chloride. . . .” (Ex. 1024 at 2.)</p>
0.2 mg/ml polysorbate 80,	<p>van Oosten: “Each vial contained . . . 0.01% polysorbate 80. . . .” (Ex. 1014 at 5.)</p> <p>Zenapax: “Each milliliter of ZENAPAX contains . . . 0.2 mg polysorbate 80. . . .” (Ex. 1024 at 2.)</p>
pH of 6.1.	<p>van Oosten: “Each vial contained . . . 20 ml of a solution . . . pH 7.2.” (Ex. 1014 at 5.)</p> <p>Zenapax: “Each milliliter of ZENAPAX . . . may contain hydrochloric acid or sodium hydroxide to adjust the pH to 6.9.” (Ex. 1024 at 2.)</p>

The only other limitations are result effective variables subject to routine optimization. As the C.C.P.A. long ago explained, “where the general conditions of a claim are disclosed in the prior art, it is not inventive to discover the optimum or workable ranges by routine experimentation.” In re Aller, 220 F.2d 454, 456 (C.C.P.A. 1955). See also In re Applied Materials, Inc., 692 F.3d 1289, 1295-96 (Fed. Cir. 2012). That is, optimization of result effective variables is “within the grasp of one of ordinary skill in the art.” Id. There is no such evidence of criticality or unexpected results here as discussed further below.

1. Challenged Claim 1

The limitations of independent claim 1 are recited in the headings of subparagraphs (a) through (f) below:

a. “A stable, aqueous pharmaceutical formulation”

The preamble is not limiting because the body of claim 1 fully sets forth all of the limitations, and the preamble merely states the intended purpose of those limitations. See Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1305 (Fed. Cir. 1999).

To the extent the preamble is a limitation, van Oosten and Zenapax disclose formulations that are necessarily aqueous. van Oosten, for example, teaches that its formulation is a “solution,” which necessarily requires a solvent. (Ex. 1002 at ¶ 95; Ex. 1014 at 5.) Similarly, Zenapax teaches a colorless concentrate in a

volume of 5 milliliters. (Ex. 1024 at 2.) Absent identification of a specific solvent in both, a person of ordinary skill in the protein formulation art would have recognized that the solvent in question is necessarily water and the formulation is thus aqueous. (Ex. 1002 at ¶ 95.) Water is of course safe for pharmaceutical administration and routinely used in parenteral formulations. (Id.) Indeed, other IgG mAb formulations, e.g., Orthoclone, teach ampules containing buffered solutions “in water for injection.” (Ex. 1022 at 3.)

With respect to the “stable” limitation, van Oosten reports favorable efficacy on CD, which demonstrates that its formulation necessarily retained its biological activity after storage and prior to administration. (Ex. 1002 at ¶ 96.) Zenapax likewise qualifies as stable, with Bell expressly teaching that Zenapax has a shelf life of 1 year. (Ex. 1025 at 4.)

It is also a basic and fundamental goal of formulation science to prepare stable formulations that retain their biological activity under storage. (Ex. 1002 at ¶ 36; Ex. 1031 at 7 (“This book is written to assist pharmaceutical scientists in the development of stable protein formulations.”).) For the same reasons the claimed formulations achieve that goal, so do the modified natalizumab formulations in Petitioner’s proposed combinations. Stable formulations containing various IgG mAbs and the claimed excipients at similar concentrations were well-known in the prior art and approved by FDA on multiple occasions, e.g., Zenapax and

Orthoclone. (Ex. 1024 at 2; Ex. 1022 at 3.) In addition, Cummins reports the extended stability of a 50 mg/ml IgG formulation containing just phosphate buffer and sodium chloride for a full twelve months. (See Ex. 1021 at 6, 8.) As Dr. Schöneich thus explains, the combination of natalizumab and the claimed excipients at optimized concentrations would necessarily or inherently create a stable formulation, especially under the broad definition of “stable” provided by the ‘321 patent. (Ex. 1002 at ¶ 144.) Indeed, an otherwise obvious formulation claim cannot become non-obvious simply by adding an inherent property to its limitations. See Santarus, Inc. v. Par Pharm., Inc., 694 F.3d 1344, 1354 (Fed. Cir. 2012).

b. “20 mg/ml of natalizumab”

There are various reasons why one of ordinary skill would replace the IgG mAbs in either van Oosten (infliximab) or Zenapax (daclizumab) with natalizumab. First, the prior art motivates the exchange because infliximab and natalizumab are known substitutes that treat the same disease states. And second, substitution of daclizumab for natalizumab combines known elements according to known methods.

van Oosten teaches that administration of its infliximab formulation results in significant improvement in patients with CD. (Ex. 1014 at 4.) Because Sorbera teaches that natalizumab effectively treats CD, the prior art motivates one of

ordinary skill to substitute it for infliximab. See In re Huellmantel, 324 F.2d 998, 1000 (C.C.P.A. 1963) (finding substitution of one steroid for another obvious because they share similar physiological activity). Infliximab and natalizumab qualify as simple substitutes because their functions, i.e., treatment of CD, was well-known in the art. And this simple substitution would have yielded the predictable results of achieving that function. (Ex. 1002 at ¶ 99.) Indeed, the scope and content of the prior art demonstrates that the excipients employed in the van Oosten formulation were compatible and worked well with various IgG mAb actives. (Id. at ¶ 100.) For example, each of van Oosten (Ex. 1014 at 5), Zenapax (Ex. 1024 at 2), Aversano (Ex. 1023 at 5) and Orthoclone (Ex. 1022 at 3) relied upon this same combination of excipients to create stable, pharmaceutically acceptable formulations. (Ex. 1002 at ¶ 100.) The result of pairing these same excipients with natalizumab is no different.⁴ (Id. at ¶ 101.) In fact, the ‘321 patent

⁴ The fact that FDA ultimately approved a lyophilized powder as opposed to the aqueous infliximab formulation of van Oosten does not teach away. Galderma Labs., L.P. v. Tolmar, Inc., 737 F.3d 731, 738 (Fed. Cir. 2013) (“A reference does not teach away . . . [if it] does not criticize, discredit, or otherwise discourage investigation into the invention claimed”). Further, the NDA holder for infliximab publicly stated that “there were no significant differences between the liquid and the two lyophilized formulations of cA2.” (Ex. 1016 at 12.)

teaches that all proteins are “interchangeable” with these excipients. (Ex. 1001 at 2:62-65.)

Alternatively, adding the natalizumab of Sorbera to the Zenapax excipients (which are identical to those of the Challenged Claims) merely combines known elements according to known methods. More than ten years before the earliest effective filing date, formulators prepared commercial formulations of Orthoclone using these very same excipients. (Ex. 1002 at ¶ 102; Ex. 1030 at 1.) And, the Zenapax formulation was approved in 1997, more than 5 years before the earliest effective filing date. (Ex. 1030 at 3.) Thus, to achieve the claimed natalizumab formulation, one of ordinary skill would have needed only to follow well-known methods for creating the final formulation, i.e., combining the IgG mAb in question with optimized excipient solutions. (Ex. 1002 at ¶ 102.)

One of ordinary skill would also have recognized that each ingredient in the Petitioner’s modified formulations would retain its original function. (Id. at ¶ 103.) And, because the modified formulations would be stable, natalizumab would retain its function. (Ex. 1011 at ¶ 21.) Sodium phosphate would buffer the formulation to a certain pH. (Ex. 1002 at ¶ 102.) Polysorbate 80 would prevent agglomeration of the IgG mAb. (Id.) And sodium chloride would provide the desired isotonicity for the IgG mAb. (Id.)

Finally, for the same reasons substitution of natalizumab in place of infliximab yields predictable results, so is the substitution of natalizumab for daclizumab. (Id. at ¶ 102.) After all, as stated in the '321 patent, antibodies in general are “interchangeable” in the claimed formulation. (Ex. 1001 at 2:62-65.)

With respect to the “20 mg/ml” limitation – this is nothing more than routine optimization of a result effective variable. The “normal desire of scientists or artisans to improve upon what is already generally known provides the motivation to determine where in a disclosed set of percentage ranges is the optimum combination of percentages.” In re Peterson, 315 F.3d 1325, 1330 (Fed. Cir. 2003). While van Oosten and Zenapax include IgG mAb concentrations of 10 mg/ml and 5 mg/ml, respectively (Ex. 1014 at 5; Ex. 1024 at 2), IgG formulations containing between 5 and 50 mg/ml were known in the art. (Ex. 1017 at 7; Ex. 1020 at 16 (e.g., Sigma F 7381 F 9636 or F 7256); Ex. 1021 at 6; Ex. 1002 at ¶ 79). One of ordinary skill would have simply calculated the appropriate concentration of natalizumab for storage in vials over a range of volumes. (Ex. 1002 at ¶ 106; Ex. 1011 at ¶ 20.)

For example, Sorbera discloses that 3 mg of natalizumab per kg of body weight (3 mg/kg) is therapeutically effective. (Ex. 1019 at 3.) Because the average adult male weighs 78.5 ± 11.8 kg, 235.5 mg (3 mg/kg * 78.5 kg) of natalizumab would have been considered necessary for a single treatment. (Ex.

1002 at ¶ 107 (citing Ex. 1037 at 6, Table 1).) Given that vials for aqueous protein formulations come in a range of different volumes, including, for example, 5, 10 and 50 ml (see Ex. 1024 at 2; Ex. 1027 at 3; Ex. 1028 at 6), a person of ordinary skill in the art would have routinely tested natalizumab over a range of concentrations that encompasses 20 mg/ml as recited in the Challenged Claims. (Ex. 1002 at ¶ 108.) No single concentration is critical because a single vial or multiple vials in combination are added to standard intravenous infusion bags for administration of 3 mg/kg. (Ex. 1011 at ¶ 20.)

c. “about 10 mM sodium phosphate buffer”

van Oosten discloses that its aqueous formulation comprises 10 mM sodium phosphate buffer. (Ex. 1014 at 5; Ex. 1002 at ¶ 109.) van Oosten thus expressly teaches this limitation.

Zenapax discloses an aqueous pharmaceutical formulation comprising 67 mM sodium phosphate buffer. This concentration is unnecessarily high (as it provides more than 1000 times the necessary buffering capacity) and is subject to routine optimization. (Ex. 1002 at ¶¶ 110-12.)

As an initial matter, buffer concentration is a result effective variable because it was known in the art to maintain the pH of pharmaceutical formulations over time. (Ex. 1002 at ¶ 41 (discussing Ex. 1029 at 12-13).) In line with existing IgG mAb formulations, pH varies between 6.0 (Ex. 1017 at 7) and 7.2 (Ex. 1014 at

5). One of ordinary skill seeking to maintain pH in this range would thus explore the minimum buffer capacity necessary to achieve this pH range through basic mathematical calculations. According to Dr. Schöneich, buffer capacity (β) is routinely calculated using the following well-known equation: $\beta = \Delta A / \Delta pH$, where ΔA is the change in acid brought about by degradation and ΔpH is the change in pH that can be tolerated. (Ex. 1002 at ¶ 44 (citing Ex. 1033 at 13).) Applying this equation to Zenapax and taking into account the level of degradation of the active drug expected over time,⁵ Dr. Schöneich calculates that only a minimum of about 0.065 mM sodium phosphate buffer would have been required to maintain a pH of 6.9 ± 0.1 . (Ex. 1002 at ¶ 110.)

Protein formulators, however, routinely seek to maintain pH by including excess buffer concentrations. (Id. at ¶ 111.) van Oosten, for example, requires a minimum buffer concentration of about 0.116 mM sodium phosphate buffer, but sets its sodium phosphate buffer concentration at 10 mM – an excess of about 86 times. (Id. at ¶ 46 (discussing Ex. 1014 at 5).) Further, a commercially available research formulation of an IgG antibody that contains 20 mg/ml protein, in 10 mM phosphate buffered saline at a pH of 7.4 would have required only 0.24 mM

⁵ If not stated otherwise, shelf life allows for no more than 10% degradation.

(Ex. 1002 at ¶ 45 (discussing Ex. 1034 at 11).)

phosphate buffer, but contains an excess of about 40 times. (Ex. 1002 at ¶ 47 (citing Ex. 1020 at 16 (Sigma F 7381 F 9636 or F 7256, for example)).)

With respect to 20 mg/ml of natalizumab at about pH 6.0 (as disclosed in Ex. 1017 at 7) or pH 6.1 (Petitioner's optimized formulation), one of ordinary skill would calculate the minimum buffer concentration of sodium phosphate to equal 1.036 mM and 0.85 mM, respectively, and would have routinely tested a range of excess buffer concentrations to ensure proper maintenance of the desired pH. (Ex. 1002 at ¶ 111.) One of ordinary skill would thus explore a buffer concentration between 10 and 100 mM phosphate buffer to achieve the claimed concentration. (Id.)

Finally, a buffer concentration of about 10 mM is in no way critical. According to Dr. Schöneich, once a minimum amount of sodium phosphate buffer has been ascertained, amounts in excess of the minimum, even up to 10 to 100 times the required minimum buffering capacity, will not negatively impact the formulation. (Ex. 1002 at ¶¶ 46-47 (discussing Ex. 1014 at 5; Ex. 1020 at 16; Ex. 1033 at 14).) Indeed, the '321 patent specification discloses an extremely wide range of buffer acceptable concentrations:

Additional liquid formulations of antibody at high concentrations, from 20-200 mg/mL may consist of phosphate or other suitable buffer (such as histidine, citrate acetate or succinate) in the concentration range of 2 to 50 mM, to provide buffering in the pH range of 3.0 to 7.0.

(Ex. 1001 at 17:41-46.) Dr. Schöneich confirms that a buffer concentration of “about 10 mM” does not represent the only concentration that will maintain a pH of about 6.0 or 6.1 for a 20 mg/ml antibody formulation. (Ex. 1002 at ¶ 112.)

d. “8.18 mg/ml sodium chloride”

van Oosten and Zenapax respectively teach concentrations of sodium chloride of 8.76 mg/ml and 4.6 mg/ml. (Ex. 1014 at 5; Ex. 1024 at 2.) One of ordinary skill would, however, routinely optimize the concentration of sodium chloride after inclusion of natalizumab to achieve isotonicity because the prior art motivates a person of ordinary skill to formulate to isotonic conditions. (Ex. 1011 at ¶ 22; Ex. 1032 at 6, 9.)

It was known in the art, per the teachings of Andya, that “[i]sotonic formulations will generally have an osmotic pressure from about 250 to 350 mOsm” and that “[i]sotonicity can be measured using a[n] . . . ice-freezing type osmometer.” (Ex. 1010 at ¶ 0051.) For example, each of Orthoclone, van Oosten and Aversano teach isotonic formulations. (Ex. 1002 at ¶ 58.) As Dr. Schöneich explains, 250 to 350 mOsm is present when a solution has a freezing point between -0.46°C and -0.64°C . (Ex. 1002 at ¶ 53 (citing the cryoscopic method, Ex. 1033 at 23-25).) To determine the appropriate concentration of sodium chloride, one of ordinary skill would simply calculate the concentration of sodium chloride necessary to depress the freezing point of the solution to within

that range. (Ex. 1002 at ¶ 55.) Using this method, Dr. Schöneich calculated that a natalizumab formulation comprising a 10 mM phosphate buffer concentration requires a sodium chloride concentration between 7.4 mg/ml and 10.5 mg/ml which encompasses the claimed concentration. (Id. at ¶ 57.) Finally, the 8.18 mg/ml concentration of sodium chloride is not critical. As Dr. Schöneich’s calculations indicate and the specification of the ‘321 patent confirms, the concentration of salt required may be more or less than 8.18, e.g., “about 140 mM.” (Ex. 1001 at 11:11.)

e. **“0.2 mg/ml polysorbate 80”**

Zenapax expressly satisfies the claim limitation reciting “0.2 mg/ml polysorbate 80.” (Ex. 1024 at 2.)

While van Oosten contains 0.1 mg/ml polysorbate 80, this concentration is also a result effective variable subject to routine optimization. (Ex. 1002 at ¶¶ 61, 118; Ex. 1029 at 18.) Those of ordinary skill knew how to increase or decrease the amount of polysorbate 80 so as to strike a balance between preventing aggregation of the antibody active and avoiding instability. (Ex. 1002 at ¶ 61.) For example, Gordon discloses 0.2 mg/ml of polysorbate 80 in a natalizumab formulation. (Ex. 1017 at 7.) In addition, methods for determining the optimum concentration of polysorbate 80 involved routine storage stability tests that were standard in the art

for decades prior to the earliest claimed filing date for the '321 patent. (Ex. 1002 at ¶ 61 (discussing stability tests in Ex. 1031 at 9-10).)

Further, no single concentration of polysorbate 80 within the claimed range is critical. (Ex. 1002 at ¶ 119.) The '321 patent discloses that polysorbate 80 may be present in amounts between 0.001% to 2.0%, inclusive (w/v). (Ex. 1001 at 1:60-62.) This is confirmed by Dr. Schöneich, explaining that more than one polysorbate concentration is suitable to prevent IgG mAb aggregation. (Ex. 1002 at ¶ 119.)

f. “pH of 6.1”

van Oosten and Zenapax both teach maintaining their formulations at a set pH. In the case of van Oosten, that pH is 7.2. (Ex. 1014 at 5.) And in the case of Zenapax, that pH is 6.9. (Ex. 1024 at 2.) Optimizing the pH of a formulation containing natalizumab would have been a matter of routine optimization accomplished through stability and solubility studies known in the art for decades. (Ex. 1002 at ¶ 40.)

As Dr. Schöneich explains, formulation pH has long been known to impact the desired solubility and stability of the therapeutically active antibody. (Id. at ¶ 39 (discussing Ex. 1031 at 13-14).) Those of ordinary skill routinely tested protein formulations, including antibody formulations, within a pH range of 5 to 7. (Ex. 1002 at ¶ 39) Prior art formulations of other IgG mAbs confirm widespread

usage and knowledge of this preferred pH range, spanning 6.0 to 7.2. (See, e.g., Ex. 1017 at 7; Ex. 1024 at 2; Ex. 1014 at 5; Ex. 1022 at 3; Ex. 1023 at 5.) In fact, Gordon teaches that its natalizumab formulation has a pH of 6.0. (Ex. 1017 at 7.)

Furthermore, a specific pH of 6.1 is in no way critical. As Dr. Schöneich explains, Orthoclone teaches that its pH may vary by as much as “ ± 0.5 .” (Ex. 1002 at ¶ 121.) Likewise, all experimental examples in the ‘321 patent list a pH of “ 6.0 ± 0.5 .” (Ex. 1001 at 16:19-17:35.) Thus, a person of ordinary skill would have expected a range of pH values, including 6.1, to help maintain the stability of the formulation. (Ex. 1002 at ¶¶ 121.)

2. Challenged Claim 2

Claim 2, dependent from independent claim 1, further requires that the formulation is “isotonic.” Not only does the prior art motivate the preparation of such an isotonic formulation through routine optimization, the modified prior art formulations that meet the limitations of claim 1 are inherently isotonic because the combination of 10 mM sodium phosphate buffer and 8.18 mg/ml sodium chloride make them so. (Ex. 1002 at ¶¶ 125-26.)

The prior art expressly motivates one of ordinary skill to prepare isotonic formulations to facilitate patient compliance and comfort. (Ex. 1011 at ¶ 22.) As previously mentioned at page 31, the goal of parenteral formulation development is to prepare isotonic formulations. As Remington’s authoritative text explains,

isotonicity is “the choice as a vehicle for many drugs which have to be administered parenterally” because it avoids tissue irritation and pain at the site of injection. (Ex. 1032 at 9, see also at 6.) One of ordinary skill would, therefore, calculate the concentration that, when combined with 10 mM sodium phosphate buffer, achieves isotonicity. (Ex. 1002 at ¶ 55.) Based on Dr. Schöneich’s calculations, that concentration is between 7.4 mg/ml and 10.5 mg/ml sodium chloride. (Id. at ¶ 57.)

Furthermore, Petitioner’s modified natalizumab formulation is inherently isotonic. Specifically, both the prior art (Andya) and the ‘321 patent specification state that “[i]sotonic formulations will generally have an osmotic pressure from about 250 to 350 mOsm,” and that “[i]sotonicity” may also be measured by an “ice-freezing type osmometer.” (Ex. 1010 at ¶ 0051; Ex. 1001 at 6:32-36.) As explained at page 31, 250 to 350 mOsm is present when a solution has a freezing point between -0.46°C and -0.64°C . (Ex. 1002 at ¶ 53 (citing Ex. 1033 at 23-25).) Dr. Schöneich determined that a 10 mM sodium phosphate buffered formulation requires between 7.4 mg/ml and 10.5 mg/ml sodium chloride to achieve isotonic conditions as defined by the ‘321 patent. (Ex. 1002 at ¶ 57.) Claim 2 thus does not add any further limitation not inherently present in claim 1 and therefore qualifies as equally obvious. See Santarus, 694 F.3d at 1354.

3. Challenged Claim 3

Claim 3 also depends from independent claim 1 and further requires that the formulation is “stable when stored at about 2° C. to about 8° C. for greater than 6 months.”

It is a basic and fundamental tenet of formulation science to prepare stable formulations that retain their biological activity under storage. (Ex. 1002 at ¶ 36; Ex. 1031 at 7 (“This book is written to assist pharmaceutical scientists in the development of stable protein formulations.”).) Stability is of course critical to the commercial manufacture of protein formulations, which often need to be shipped around the world and maintained under storage for extended periods. (Ex. 1002 at ¶ 37.) That is why standard stability tests have existed in the prior art for decades. (Id. at ¶ 36.) According to Bell, the “[s]helf life of Zenapax is 1 year” and “[v]ials should be stored between 36° – 46° F” (equivalent to 2° C to 8 ° C). (Ex. 1025 at 4.) Cummins reports 12 month stability (0° to 8°C storage) of a 50 mg/ml IgG solution in normal saline alone. (Ex. 1021 at 8.) Similarly, White discloses several commercially available formulations ready for shipment around the country, each comprising 20 mg/ml concentrations of IgG in 5 mM or 10 mM PBS. (Ex. 1020 at 14 (USBio I1903-31) and 16 (Sigma F 7381, F 9636 and F 7256).)

Against that backdrop, Petitioner’s modified formulation would ensure the stability of natalizumab active under the conditions specified in claim 3. Indeed, as Dr. Schöneich explains, the teachings of Zenapax, Cummins, and White indicate that a 20 mg/ml natalizumab formulation with sodium chloride, phosphate buffer and polysorbate 80 would retain its biological activity for greater than six months under the conditions specified by claim 3 of the ‘321 patent. (Ex. 1002 at ¶ 128.)

Furthermore, because Petitioner’s modified prior art formulations satisfy all limitations of claim 1, they necessarily achieve the same stability as set forth in claim 3. See Santarus, 694 F.3d at 1354; In re Spada, 911 F.2d 705, 708 (Fed. Cir. 1990) (“products of identical chemical composition cannot have mutually exclusive properties”).

4. Challenged Claim 4

Claim 4 depends from claim 1 and adds “a container” for holding the stable, aqueous pharmaceutical formulations of claim 1. van Oosten states that its infliximab formulation was stored in a “vial.” (Ex. 1014 at 5.) Similarly, Zenapax teaches that its daclizumab formulation is supplied in a 5 ml “vial.” (Ex. 1024 at 3.)

5. Reasonable Expectation of Success

A person of ordinary skill in the art would have had at least a reasonable expectation of producing a stable formulation by substituting natalizumab for van

Oosten's infliximab and Zenapax's daclizumab. (Ex. 1002 at ¶ 131.) As the Federal Circuit has repeatedly explained, absolute predictability is not required: "[o]bviousness cannot be avoided simply by a showing of some degree of unpredictability in the art so long as there was a reasonable probability of success." Pfizer, Inc. v. Apotex, Inc., 480 F.3d 1348, 1364 (Fed. Cir. 2007). In this case, the prior art demonstrates the stability of IgG mAb formulations containing the excipients recited by the Challenged Claims of the '321 patent. Further, key overlapping structural characteristics shared by IgG mAbs means they behave comparably in formulations containing identical excipients.

As discussed above in Sections VII.B.1-4, one of ordinary skill would have reasonably expected that the claimed natalizumab formulation could have been made through routine experimentation. Each and every excipient recited by the claims – sodium phosphate buffer, sodium chloride and polysorbate 80 – was not only individually known but had been repeatedly and successfully used together in prior art IgG mAb formulations to create stable formulations years before the '321 patent. (Ex. 1002 at ¶¶ 131-32.) Furthermore, given the extensive literature discussing how to optimize concentrations for such excipients, one of ordinary skill could have readily prepared the claimed formulation through routine testing. (Id. at ¶ 131; Ex. 1031 at 9, 10.)

Similarly, one of ordinary skill would have reasonably expected such an optimized formulation to achieve its intended purpose of remaining “stable” under storage, especially under the ‘321 patent’s broad definition of this term. (Ex. 1002 at ¶¶ 96, 131.) Stable formulations containing various IgG mAbs and the claimed excipients were both well-known in the prior art and approved by FDA on multiple occasions, e.g., Orthoclone and Zenapax. (Ex. 1022 at 3; Ex. 1024 at 2.) Cummins reports 12 month stability (0° to 8°C storage) of a 50 mg/ml IgG solution in normal saline. (Ex. 1021 at 8.) And White discloses several commercially available formulations ready for shipment around the country, each comprising 20 mg/ml concentrations of IgG in 5 mM or 10 mM PBS. (Ex. 1020 at 14 (USBio I1903-31) and 16 (Sigma F 7381, F 9636 and F 7256).)

According to Dr. Schöneich, the existence of prior art formulations employing such high concentrations of IgG actives leads a person of ordinary skill to expect that a 20 mg/ml natalizumab formulation comprising these same excipients would also retain biological activity under storage. (Ex. 1002 at ¶¶ 128, 132.) One of ordinary skill would, therefore, have reasonably expected the combination of natalizumab with the claimed excipients at optimized concentrations to support a stable final formulation.

Furthermore, IgG mAbs represent a specific population of proteins sharing key structural characteristics germane to formulation development. These shared

characteristics would have provided a person of ordinary skill in the art with a reasonable expectation that a formulation useful for one IgG mAb would be useful for another. (Ex. 1002 at ¶ 132.)

Among those characteristics are the primary amino sequence and secondary, tertiary and quaternary structures of the antibodies. (Id. at ¶ 34 (discussing Ex. 1035 at 8-23; Ex. 1036 at 11-21).) As Dr. Schöneich explains, IgG mAbs share essentially identical secondary, tertiary and quaternary structures, which structures are important to ensuring comparable behavior in identical formulations. (Ex. 1002 at ¶ 34.) In addition, the primary amino acid sequence of different IgG mAb actives can share 95% identity. (Id.) But even when the primary acid amino acid sequence differs by a greater percentage, many of the amino acid changes are conservative and would not affect the behavior of the IgG mAb actives within the same formulation. (Id.) For example, the four prior art IgG mAbs that were developed for clinical use have differences in subtype (IgG₁ vs. IgG₄) and species (humanized vs. chimeric vs. mouse). (Ex. 1002 at ¶ 132 (referring to Ex. 1024; Ex. 1023; Ex. 1014; Ex. 1022).) Yet all four formulations (see Table 1, above at p. 16) were successfully formulated with the same three excipients, sodium phosphate buffer, sodium chloride and polysorbate 80. (Ex. 1002 at ¶ 132.) Thus, a person of skill would have had a reasonable expectation that one IgG mAb would exhibit similar behavior as another in the optimized formulation.

Accordingly, a person of ordinary skill in the art would have had at least a reasonable expectation that natalizumab formulated with a combination of sodium phosphate buffer, sodium chloride and polysorbate 80 would result in a stable, aqueous natalizumab formulation, as recited in claim 1 of the '321 patent. (Id. at ¶ 132.)

Applicants' contrary argument during prosecution based on Wang (Ex. 1046) and Cleland (Ex. 1047) not only overstates the teachings of those references, but also ignores express statements in the '321 patent regarding "interchangeable" proteins and antibodies. Wang and Cleland do not stand for the proposition that the knowledge and experience of skilled antibody formulators can be swept aside during development of comparable antibody formulations employing different IgG mAb actives. Although Wang and Cleland generically discuss issues when formulating proteins in general, neither focuses on formulations comprising IgG mAbs in particular. And neither states that antibodies in general, let alone IgG mAbs, are not readily interchangeable in formulations. (Ex. 1002 at ¶ 135.) Perhaps more importantly, there is no indication that Wang or Cleland appreciated that multiple IgG mAb prior art formulations successfully relied upon the exact same excipients at similar concentrations. (Id.) Furthermore, this tribunal should not permit Patent Owner to reinstate its arguments over Wang and Cleland given its prior representation to the

Patent Office that all proteins are “interchangeable” in such formulations. (Ex. 1001 at 2:62-65.)

Given the foregoing, the general disclosures in Wang and Cleland cannot rebut the reasonable expectation of success created by Petitioner’s combination of prior art. If that were the case, all new protein formulations would qualify as non-obvious and patentable. But that simply is not law:

A rule of law equating unpredictability to patentability, applied in this case would mean that any new salt ... would be separately patentable, simply because the formation and properties of each salt must be verified through testing. This cannot be the proper standard since the expectation of success need only be reasonable not absolute.

Pfizer, 480 F.3d at 1364. Like the situation in Pfizer, Patent Owner cannot claim that every new protein formulation is non-obvious simply because testing would be required to determine whether the protein actives are interchangeable.

C. Ground 2 – The Challenged Claims are Obvious under 35 U.S.C. § 103(a) over Gordon in View of Orthoclone or Aversano

Gordon teaches a natalizumab formulation containing all of the claimed excipients, with the exception of histidine buffer in place of sodium phosphate buffer. Each of the secondary references, Orthoclone or Aversano, teaches IgG mAb formulations with precisely the same excipients recited by the Challenged Claims – sodium phosphate buffer, sodium chloride and polysorbate 80. A person of ordinary skill would have been motivated to replace the histidine buffer of

Gordon with sodium phosphate buffer of the secondary references because Subramanian reported that formulations containing histidine buffer combined with polysorbate 80 impair the biological activity of an IgG mAb. Not only had sodium phosphate buffer worked with numerous prior art IgG mAb formulations, such a modification represents simple substitution of one known element for another. The following chart reflects these combinations.

Claim 1	Prior Art
A stable, aqueous pharmaceutical formulation comprising	<p>Gordon: “Natalizumab (5 mg/mL) was formulated in a solution.” (Ex. 1017 at 7.)</p> <p>Orthoclone: “The antibody is a biochemically purified IgG_{2a} immunoglobulin” and that “[e]ach 5 mL ampule of ORTHOCLONE OKT3 Sterile Solution contains 5 mg (1 mg/mL) of muromonab-CD3 in a clear colorless solution.” (Ex. 1022 at 3.)</p> <p>Aversano: “The chimeric CLB54 monoclonal antibody used in this study is a human/mouse genetic reconstruction of a murine monoclonal IgG4 molecule that binds selectively to the neutrophil CD18 receptor.” (Ex. 1023 at 5.) “It was supplied as a sterile, nonpyrogenic solution of 5 mg of monoclonal IgG4 per milliliter of buffer solution.” (Id.)</p>
from about 20 mg/ml of natalizumab,	<p>Gordon: “Natalizumab (5 mg/mL) was formulated in a solution.” (Ex. 1017 at 7.)</p> <p>Orthoclone: “The antibody is a biochemically purified IgG_{2a} immunoglobulin” and that “[e]ach 5 mL ampule of ORTHOCLONE OKT3 Sterile Solution contains 5 mg (1 mg/mL) of muromonab-CD3 in a clear colorless solution.” (Ex. 1022 at 3.)</p> <p>Aversano: “The chimeric CLB54 monoclonal antibody used in this study is a human/mouse genetic reconstruction of a murine monoclonal IgG4 molecule that binds selectively to the neutrophil CD18 receptor.” (Ex. 1023 at 5.) “It was supplied as a sterile, nonpyrogenic solution of 5 mg of monoclonal IgG4 per</p>

	milliliter of buffer solution.” (<u>Id.</u>)
about 10 mM sodium phosphate buffer,	Gordon: “[S]olution [had] 50 mmol/L histidine buffer.” (Ex. 1017 at 7.) Orthoclone: “Each ampule contains a buffered solution (pH 7.0 ±0.5) of monobasic sodium phosphate (2.25 mg), dibasic sodium phosphate (9.0 mg). . . .” (Ex. 1022 at 3.) Aversano: “[S]terile, nonpyrogenic solution . . . contain[s] . . . 0.01 mol/liter of sodium phosphate. . . .” (Ex. 1023 at 5.)
8.18 mg/ml of sodium chloride,	Orthoclone: “Each 5 mL ampule . . . contains a buffered solution [of] . . . sodium chloride (43 mg) . . . in water.” (Ex. 1022 at 3.) Aversano: “[S]terile, nonpyrogenic solution . . . contain[s] 0.15 mol/liter of sodium chloride. . . .” (Ex. 1023 at 5.)
0.2 mg/ml of polysorbate 80,	Gordon: “[S]olution . . . [had] 0.02% polysorbate 80.” (Ex. 1017 at 7.) Orthoclone: “Each 5 mL ampule . . . contains . . . polysorbate 80 (1 mg). . . .” (Ex. 1022 at 3.) Aversano: “[S]terile, nonpyrogenic solution . . . contain[s] . . . 0.01% of polysorbate 80. . . .” (Ex. 1023 at 5.)
pH 6.1.	Gordon: “[S]olution . . . adjusted to pH 6 with hydrochloric acid.” (Ex. 1017 at 7.) Orthoclone: “Each ampule contains a buffered solution (pH 7 ±0.5). . . .” (Ex. 1022 at 3.) Aversano: “[S]terile, nonpyrogenic solution . . . at pH 6.5.” (Ex. 1023 at 5.)

1. Challenged Claim 1

The features of independent claim 1 appear in the headings of sub-parts (a) through (f) below:

a. **“A stable, aqueous pharmaceutical formulation”**

To the extent the preamble limits claim 1, Gordon teaches that its formulation is in “solution,” which necessarily requires a solvent. (Ex. 1017 at 7.) As previously mentioned, absent identification of a specific solvent, a person of ordinary skill in the protein formulation art would have recognized that the solvent in question is necessarily water and the formulation is thus aqueous. (Ex. 1002 at ¶ 143.) Water is of course safe for pharmaceutical administration and routinely used in parenteral formulations. (*Id.*) Furthermore, Orthoclone and Aversano also disclose this limitation. As mentioned, Orthoclone teaches a buffered solution “in water for injection.” (Ex. 1022 at 3.) Like Gordon, Aversano teaches that its formulation is in “solution,” which necessarily requires a solvent, for the same reasons as described for Gordon. (Ex. 1023 at 5.)

Further, the prior art teaches the importance of stable formulations and a skilled formulator would know how to create them. Under the broad definition for “stable,” Gordon qualifies as stable inasmuch as the formulation was necessarily stored prior to administration. (Ex. 1002 at ¶ 144.) Gordon’s formulation was made and shipped from “Elan Pharma Ltd.” in England (Ex. 1017 at 6.) Aversano and Orthoclone also disclose stable formulations. Aversano’s formulation was made and shipped from “Centocor, Inc.” (Ex. 1023 at 5.) As an FDA-approved formulation shipped around the country, Orthoclone also qualifies as “stable.”

(Ex. 1002 at ¶ 144.) In fact, Remington’s indicated that Orthoclone had a shelf-life of 1 year. (Ex. 1032 at 9.) As Dr. Schöneich also points out, various prior art formulations comprising the identical combination of claimed excipients qualified as stable. (Ex. 1002 at ¶ 144 (citing Ex. 1014; Ex. 1024; Ex. 1022; and Ex. 1023).) According to Dr. Schöneich, the combination of natalizumab and the claimed excipients at optimized concentrations create a stable formulation, especially under the broad definition provided by the ‘321 patent. (Ex. 1002 at ¶ 144.) Indeed, the modified Gordon formulation substituting sodium phosphate for histidine, which satisfies all limitations of claim 1, is inherently stable. See Santarus, 694 F.3d at 1354.

b. “20 mg/ml of natalizumab”

Although Gordon only discloses that the aqueous formulation includes 5 mg/ml natalizumab (Ex. 1017 at 7), this difference in concentration represents nothing more than routine optimization of a result effective variable. In this regard, Petitioner incorporates by reference its discussion beginning on page 27.

c. “about 10 mM sodium phosphate buffer”

Gordon’s natalizumab formulation includes a histidine buffer, which one of ordinary skill would have readily exchanged with the sodium phosphate buffer of Orthoclone or Aversano because (1) the classic teaching/suggestion/motivation or “TSM” rationale points directly toward use of sodium phosphate buffer and,

independently (2) such use is no more than a simple substitution of one known buffer for another with predictable results. (Ex. 1002 at ¶¶ 146-51.)

Turning first to TSM – shortly after Gordon published, Subramanian taught those of ordinary skill that histidine buffer combined with polysorbate 80 caused accelerated degradation of IgG mAb actives. (Ex. 1026 at 4.) One of ordinary skill looking for an alternative to histidine buffer would quickly zero in on sodium phosphate. (Ex. 1002 at ¶ 147.) As discussed at length above in the scope and content, numerous IgG mAb formulations repeatedly and successfully used polysorbate 80 with a sodium phosphate buffer and sodium chloride. In fact, FDA approved two of these formulations – Orthoclone and Zenapax – and the combined use of these excipients was common practice in the field for antibody and other protein formulations. (Ex. 1002 at ¶ 147.)

Such extensive and successful use of these inactive ingredients with other IgG mAbs would have motivated one of ordinary skill reviewing Gordon, which discloses natalizumab along with polysorbate 80 and the problematic histidine buffer, to incorporate sodium phosphate buffer in place of histidine. (Id.) The skilled artisans' choices were limited, given that only a few buffers had been previously approved by FDA for maintaining a pH of about 6.0, including, for example, histidine, sodium phosphate and sodium citrate. (Ex. 1029 at 13.)

Furthermore, unlike the histidine and citrate buffers criticized by Subramanian, sodium phosphate was known to be compatible with both IgG mAbs and polysorbate 80 without the prospect of accelerated potency loss. (Ex. 1002 at ¶ 147 (discussing Ex. 1014; Ex. 1024; and Ex. 1022).) Even putting Subramanian aside, there exists a rationale for selection of the sodium phosphate buffer of Orthoclone inasmuch as this excipient qualifies as a simple substitute for Gordon's histidine. It was well-known that both histidine and sodium phosphate were safe buffers whose function was to maintain the pH of IgG mAb formulations over time. (Ex. 1002 at ¶ 148.) Indeed, Frokjaer teaches that both phosphate and histidine buffers were among the group of a few buffers used in protein formulations at pH of about 6.0. (Ex. 1029 at 13.)

Further, simple substitution of histidine with sodium phosphate would lead to the predictable result of a stable formulation. (Ex. 1002 at ¶ 149.) Numerous stable formulations comprising an IgG mAb active along with the combination of excipients polysorbate 80, sodium chloride and sodium phosphate buffer, were known in the prior art. At least two of these formulations were FDA-approved. (Ex. 1022; Ex. 1024.) Thus, simple substitution of histidine with sodium phosphate would have led to the predictable result of a stable formulation. (Ex. 1002 at ¶ 149.)

The 10 mM concentration is also subject to routine optimization. As discussed starting at page 28, those of ordinary skill routinely calculated optimal buffer concentrations using mathematical equations well-known in the prior art and such concentration is not critical. Aversano, for example, uses 10 mM sodium phosphate buffer. (Ex. 1023 at 5.)

d. “8.18 mg/ml sodium chloride”

To answer whether Gordon satisfies the sodium chloride limitation, some brief background is necessary. More specifically, Gordon expressly teaches two formulations – (1) a pre-dilution formulation and (2) a post-dilution formulation. (Ex. 1017 at 7.) To be clear, Petitioner’s focus for purposes of Ground 2 is the pre-dilution formulation.

The prior art motivates sodium chloride addition to the pre-dilution formulation because isotonic conditions are necessary for patient comfort. (Ex. 1002 at ¶ 153; Ex. 1011 at ¶ 22; Ex. 1032 at 6.) As discussed starting at page 31, the prior art teaches that “[i]sotonic formulations will generally have an osmotic pressure from about 250 to 350 mOsm.” (Ex. 1010 at ¶ 0051.) And sodium chloride was the excipient of choice for achieving isotonic conditions. (Ex. 1002 at ¶ 50; Ex. 1032 at 9.) In addition, numerous IgG mAb formulations employing sodium phosphate buffer and polysorbate 80 also include sodium chloride for this very reason. For example, multiple FDA-approved prior art

formulations, including both Orthoclone and Zenapax, include sodium chloride. (Ex. 1022 at 3; Ex. 1024 at 2.) Thus, a person of ordinary skill in the art would have added sodium chloride to the formulation prior to dilution.

It also bears noting that a person of ordinary skill reading Gordon would have understood its pre-dilution formulation to necessarily contain sodium chloride. Extrinsic sources, including Bendig and the '321 patent itself, confirm that Gordon's pre-dilution formulation contains sodium chloride. See Schering Corp. v. Geneva Pharm., 339 F.3d 1373, 1382-83 (Fed. Cir. 2003) (evidence external to a prior art reference, created after the patent-in-suit was filed, may be used to establish that each claimed element was necessarily present in the prior art). Bendig, assigned to Elan Pharmaceuticals (Ex. 1030 at 5), the same entity sponsoring Gordon's research (Ex. 1017 at 12; Ex. 1002 at ¶¶ 65, 68), discloses a preferred formulation of natalizumab, 50 mM histidine buffer and 150 mM sodium chloride at a pH of 6.0 without dilution. (Ex. 1018 at 14:18-21.) The '321 patent, originally filed by Elan Pharmaceuticals, reports that polysorbate 80 was added to the original formulation used in clinical trials, i.e., the Bendig formulation. (Ex. 1001 at 12:9-16.) The inference is thus strong that Gordon built on the work of Bendig and added polysorbate 80 to Bendig's pre-dilution formulation containing histidine buffer and 150 mM sodium chloride.

Moreover, a person of ordinary skill would have recognized the presence of sodium chloride in the pre-dilution formulation because without it the post-dilution formulation would not qualify as isotonic. The prior art of course teaches that isotonic conditions are highly desirable for intravenous administration. (Ex. 1011 at ¶ 22; Ex. 1032 at 6.) As the '321 patent itself states, “[i]ntravenous administration requires the final formulation to be isotonic.” (Ex. 1001 at 12:8-9.) If Gordon’s pre-dilution formulation truly does not contain salt, its dilution with 0.9% saline would result in an undesirably hypotonic solution. (Ex. 1002 at ¶ 152.) That is because the amount of saline added is insufficient to bring the diluted solution within the range of osmotic pressures identified by the prior art as isotonic. (Ex. 1010 at ¶ 0051; Ex. 1002 at ¶ 152.) Thus, the only way the post-dilution solution could qualify as isotonic is if the pre-dilution formulation already contained sufficient sodium chloride to make it so. (Ex. 1002 at ¶ 152.) According to Dr. Schöneich, a person of ordinary skill in the art reading Gordon would conclude that the pre-dilution formulation already included sodium chloride. (Id.)

Finally, as to the concentration of 8.18 mg/ml sodium chloride, as discussed starting at page 31, the concentration of sodium chloride required by Challenged Claim 1 is subject to routine optimization. As Dr. Schöneich explains, achieving isotonic conditions for a 10 mM sodium phosphate buffered formulation requires

sodium chloride to be at a concentration of between 7.4 mg/ml and 10.5 mg/ml which encompasses the claimed concentration. (Ex. 1002 at ¶ 57.) For these reasons, a formulator with Gordon in hand would have included a sufficient concentration of sodium chloride in the pre-dilution formulation before placing it in a vial. (Ex. 1002 at ¶ 154.)

e. “0.2 mg/ml polysorbate 80”

Gordon’s natalizumab formulation includes 0.2 mg/ml polysorbate 80, thus Gordon satisfies this limitation. (Ex. 1017 at 7.) Regardless, the concentration of polysorbate 80 is a result effective variable subject to routine optimization. (See p. 32, above.)

f. “pH of 6.1”

Gordon’s natalizumab formulation has a pH of 6.0. (Ex. 1017 at 7.) Thus, the pH of Gordon’s formulation is “so close [to the Challenged Claim] that one skilled in the art would have expected them to have the same properties. See Titanium Metals Corp. of Am. v. Banner, 778 F.2d 775, 783 (Fed. Cir. 1985.)

Furthermore, according to Dr. Schöneich, one of ordinary skill would have expected a formulation with a pH of 6.0 to exhibit the same properties as a formulation with a pH of 6.1 because such a small change in pH would not materially affect the stability. (Ex. 1002 at ¶ 121.) Orthoclone confirms this point, teaching that its pH may vary by as much as “±0.5,” far greater a range than the

difference between the pH of 6 as disclosed by Gordon and the pH of 6.1 of the Challenged Claim. (Ex. 1022 at 3.) This is also confirmed by each example in the '321 patent, which recites pH 6.0 ± 0.5 . (Ex. 1001 at 16:19-17:36.)

The claimed pH is also subject to routine optimization. (See p. 33.) There is nothing special about a pH of exactly 6.1. (Ex. 1002 at ¶ 121.)

2. Challenged Claim 2

Claim 2 further requires that the formulation of claim 1 is isotonic. For the same reasons discussed above starting at page 34, the prior art motivates one of ordinary skill to formulate at isotonicity. One of ordinary skill would adjust the concentration of sodium chloride by calculating the sodium chloride concentration necessary to achieve isotonicity. According to Dr. Schöneich's calculations, the optimized formulation includes a sodium chloride concentration of 7.4 mg/ml and 10.5 mg/ml, which would qualify as isotonic. (Id. at ¶ 57.) Indeed, the modified Gordon formulation is necessarily isotonic because the combination of 10 mM phosphate buffer and 8.18 mg/ml sodium chloride is an isotonic formulation. (Id. at ¶ 160.) Claim 2 thus does not add any further limitation not inherently present in claim 1 and is, therefore, equally obvious. See Santarus, 694 F.3d at 1354.

3. Challenged Claim 3

Claim 3 further requires that the formulation is "stable when stored at about 2° C. to about 8° C. for greater than 6 months." As explained starting at page 36,

Petitioner’s modified natalizumab formulations, which satisfy all limitations of claim 1, are stable under these conditions. Not only does the prior art motivate skilled formulators to prepare formulations with extended stability and shelf life, numerous prior art formulations containing the same excipients recited by the Challenged Claims exhibited such stability. (Ex. 1002 at ¶ 161; see also, Ex. 1022; Ex. 1024.) Furthermore, just like claim 2, claim 3 adds a limitation inherently present in claim 1 and is, therefore, equally obvious. See Santarus, 694 F.3d at 1354.

4. Challenged Claim 4

Claim 4 recites nothing more than a container. Gordon states “[n]atalizumab (5 mg/ml) was formulated in a solution of 50 mmol/L histidine buffer and 0.02% polysorbate 80 adjusted to pH 6 with hydrochloric acid and was diluted to 100 ml in 0.9% saline for administration.” (Ex. 1017 at 7.) According to Dr. Schöneich, the 5 mg/ml natalizumab formulation necessarily resided in a container, either a vial or ampule, prior to dilution. (Ex. 1002 at ¶ 162.) Similarly, Orthoclone states that the IgG mAb muromonab-CD3 resides in an “ampule.” (Ex. 1022 at 3.) Aversano states that the CLB54 monoclonal antibody “was supplied as a sterile, nonpyrogenic solution” and thus it must have been in a sealed vial or ampule. (Ex. 1023 at 5.) Thus, Gordon, Orthoclone and Aversano teach a

container for holding their stable formulations, which renders claim 4 invalid as obvious.

To the extent Gordon does not inherently disclose a container, the prior art would have motivated one of ordinary skill to incorporate the formulation into a container for practical reasons, i.e., ease of storage, handling, shipping or delivery. The prior art, for example, discloses the use of ampules for storing Orthoclone. And as Dr. Schöneich explains, it was vital that an injectable liquid formulation reside in a container for shipping, delivery and storage. (Ex. 1002 at ¶ 163.)

5. Reasonable Expectation of Success

The person of ordinary skill in the art would also have had a reasonable expectation that the combination of Gordon (Ex. 1017) and Orthoclone (Ex. 1022) or Aversano (Ex. 1023) would successfully result in the claimed stable natalizumab formulation. See Pfizer, 480 F.3d at 1364. As discussed in great detail starting at page 37 above, those of ordinary skill recognized that the claimed formulation could be made and would work for its intended purpose. (Ex. 1002 at ¶ 165.) Once again, the prior art reports several stable IgG mAb formulations with excipients identical to those recited by the Challenged Claims. And the IgG mAb actives in these formulations share key structural characteristics leading to comparable behavior in comparable formulations.

D. Statement of No Redundancy

Neither vertical nor horizontal redundancy is present here. With respect to Ground 1, the rationale for modifying van Oosten with Sorbera (simple substitution) is different than the motivation to modify Zenapax with Sorbera (combining known elements). The alternate combinations of Ground 2 are also distinct because the secondary references, Orthoclone and Aversano, each present different concentrations of excipients, making routine optimization necessary in some cases but not others. Finally, Grounds 1 and 2 themselves are not redundant because each presents entirely different primary references leading to distinct substitutions and rationales. Ground 1 starts with a formulation satisfying all formulation components and replaces the active IgG mAb with natalizumab. Ground 2 starts with a known natalizumab formulation and substitutes one of the formulation excipients, i.e., a buffer. The Grounds thus do not qualify as vertically or horizontally redundant.

E. Secondary Considerations of Nonobviousness Fail to Overcome the Strong *Prima Facie* Showing of Obviousness

Petitioners are not aware of any evidence of secondary considerations of nonobviousness sufficient to rescue the Challenged Claims from the strong case for *prima facie* obviousness discussed herein. See, e.g., Q.I. Press Controls, B.V. v. Lee, 752 F.3d 1371, 1379-80 (Fed. Cir. 2014); Ohio Willow Wood Co. v. Alps S., LLC, 735 F.3d 1333, 1344 (Fed. Cir. 2013).

During prosecution of the ‘321 patent , Applicants alleged unexpected results, but the Preformulation Study they relied upon was “based on preliminary data which was not accurate . . . [and] could not be reproduced” by their own admission. (Ex. 1040 at 1.) Furthermore, and as Dr. Schöneich explains in his declaration, even if the Preformulation Study data were accurate and reproducible, such data does not support unexpected results. (Ex. 1002 at ¶ 175.) For example, the protein concentration for the only formulation using polysorbate 80 (which also contained sodium chloride) purportedly increased, rather than decreased as would have been expected if the protein was degrading. (Ex. 1002 at ¶ 176; Ex. 1038 at 20, Table 2.) In addition, that same formulation was able to maintain a stable pH over 8 weeks – the same pH as in a similar formulation without the polysorbate 80. (Ex. 1038 at 19, Table 1.) And a different formulation using phosphate buffer maintains the exact same pH over time both with and without sodium chloride. (Id.) According to Dr. Schöneich, these results do not support the Applicants’ assertions in support of the alleged unexpected results that “the inclusion of sodium chloride or [polysorbate] 80 was found to accelerate the degradation process.” (Ex. 1002 at ¶ 186; see also Ex. 1048 at 5.)

Commercial success also cannot rescue the ‘321 patent. To the extent commercial success, if any, exists, it must trace back to the therapeutic activity of the natalizumab active, which was well-known in the prior art before the ‘321

patent. (Ex. 1011 at ¶ 17.) As the Federal Circuit has explained, “if the feature that creates the commercial success was known in the prior art, the success is not pertinent.” Ormco Corp. v. Align Technology, Inc., 463 F.3d 1299, 1312 (Fed. Cir. 2006).

F. The Examiner Relied On Incorrect and Incomplete Information

Finally, the prosecution history of the ‘321 patent reveals that the Examiner premised allowance on incorrect and incomplete information.

First, the Examiner was not aware of the extensive prior art disclosing IgG mAb formulations comprising the same three excipients recited by the Challenged Claims. The existence of these formulations refutes the Applicants’ contentions that the prior art did not evidence any reasonable expectation of success.

Second, the Examiner was not aware that the prior art, namely Subramanian (Ex. 1026), discloses accelerated potency loss of IgG mAb actives attributable to histidine buffers in the presence of polysorbate 80. Subramanian would have led one of ordinary skill to identify the problem with Gordon, thereby refuting the Applicants’ suggestion during prosecution that testing Gordon would lead one of ordinary skill away from its formulation. (Ex. 1045 at 13-14; Ex. 1048 at 5.)

Third, the Examiner relied heavily upon Applicants’ representations concerning the Preformulation Study in support of allegedly unexpected results. What Applicants neglected to provide, however, was their public admission in

another forum that this study was inaccurate and non-reproducible. On February 3, 2016, the Applicants' representative told the EPO that the results of the Preformulation Study "showed that the natalizumab antibody was relatively stable in *all* of the formulations evaluated," (Ex. 1041 at 10) (emphasis added), which contradicts their assertion to the Patent Office regarding degradation problems with either sodium chloride or polysorbate 80. (Ex. 1048 at 5.)

VIII. CONCLUSION

Given the foregoing, Petitioner respectfully submits that it has shown a reasonable likelihood that Challenged Claims 1-4 of the '321 patent are obvious. Petitioner requests, therefore, that the Board institute *inter partes* review for each of these claims.

Respectfully submitted,

Axinn, Veltrop & Harkrider, LLP
